Sewer Lining

Advantages for Lining of a House Sewer From Inside of the House

- Renews cast iron piping from under the foundation all the way to, and including, the main sewer connection in the street. Digging does not.
- Lining has no joints but is smooth continuous pipe. This allows for better flow characteristics.
- Requires no disturbance of foundation, porches, shrubbery, sidewalks, driveways and streets.
- Requires no additional landscaping expense.
- Does not disturb the texture or color of grass, which is hard to match.
- Can be done anytime of the year. Frost or ledge removal is expensive when digging and you never know when it will be encountered.
- The life expectancy of these materials is approximately 50 years.
- The lining materials are completely root impervious. All other types of piping are not.
- The lining materials are much stronger than other types of sewer piping.
- No expensive street opening permits
